(Press  for slide notes)

Motivation

Hull & McCarthy (1987).
Change in the Landscape.
Landscape and Urban Planning 15 (3–4): 265–78.
[DOI](#)

Types of changes (p. 266f):

slow (gentrification of neighborhoods, growth of vegetation)

sudden (weather fluctuations)

regular (seasonal in plants, animal migration, sunrises)

frequent (presence of wildlife, wind, sounds)

infrequent (fire, floods)

long duration (buildings, roads, consequences of natural disasters)

medium duration (harvesting of trees, seasons)

ephemeral-periodic (wildlife, weather, hiking, evidence of other hikers)

...

User-contributed geodata & social media

A complementary data source for assessing subjective landscape values

Dunkel (2015). [DOI](#)

Preprocessing steps:

- query data from Application Programming Interfaces (APIs)
- data cleansing, transformation into a common data scheme,

LBSN Structure [↗](#)

- privacy-preserving & ethical data processing, Dunkel et al. (2020). [DOI](#)
- aggregation, visualization

Dunkel et al. (2023).

From Sunrise to Sunset: Exploring Landscape Preference through Global Reactions to Ephemeral Events Captured in Georeferenced Social Media.

PLOS ONE 18 (2): e0280423.

[DOI.](#)

Reliably identify landscape values,
independent of overall visitation frequency?

Signed Chi

$$chi_t = \frac{((obs_t * norm) - exp_t)}{\sqrt{exp_t}} \quad norm = \frac{\Sigma_{exp}}{\Sigma_{obs}}$$

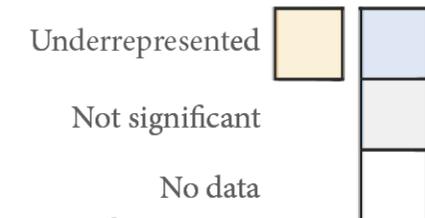

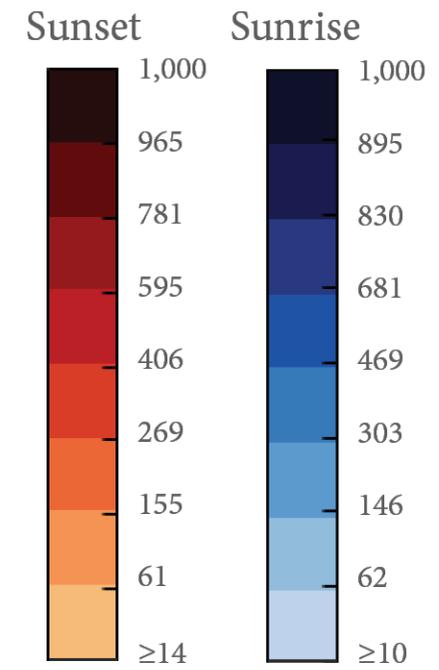

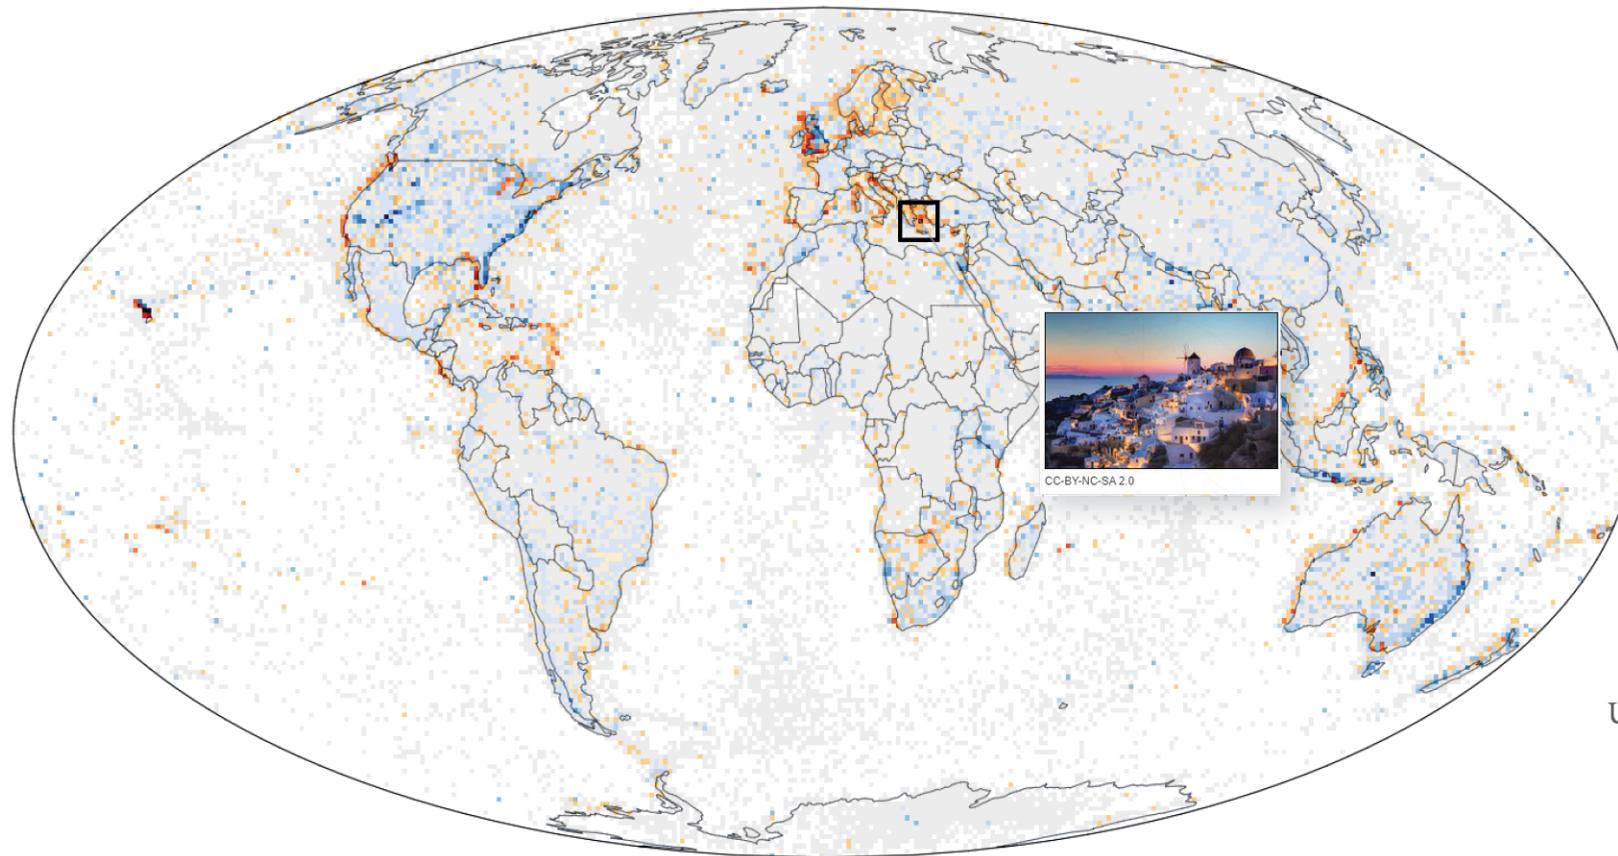

1. A generic query (expected; e.g. all Flickr images)
2. A specific query (observed; e.g. "sunset"-reactions)

Visvalingam (1978). The Signed Chi-Square Measure for Mapping.
Cartographic Journal 15: 93–98. [DOI](#)

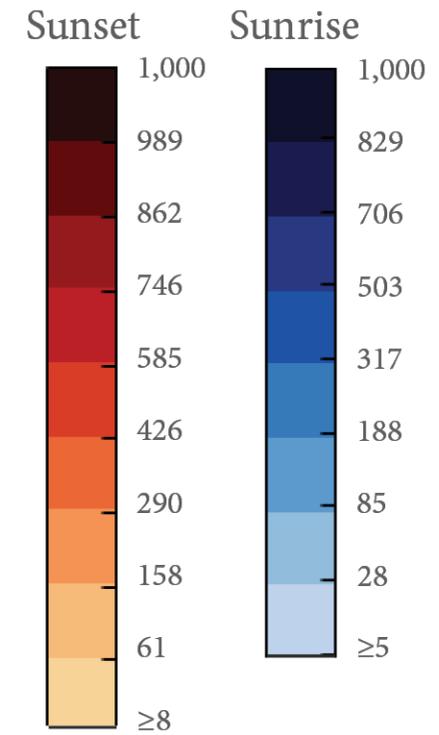

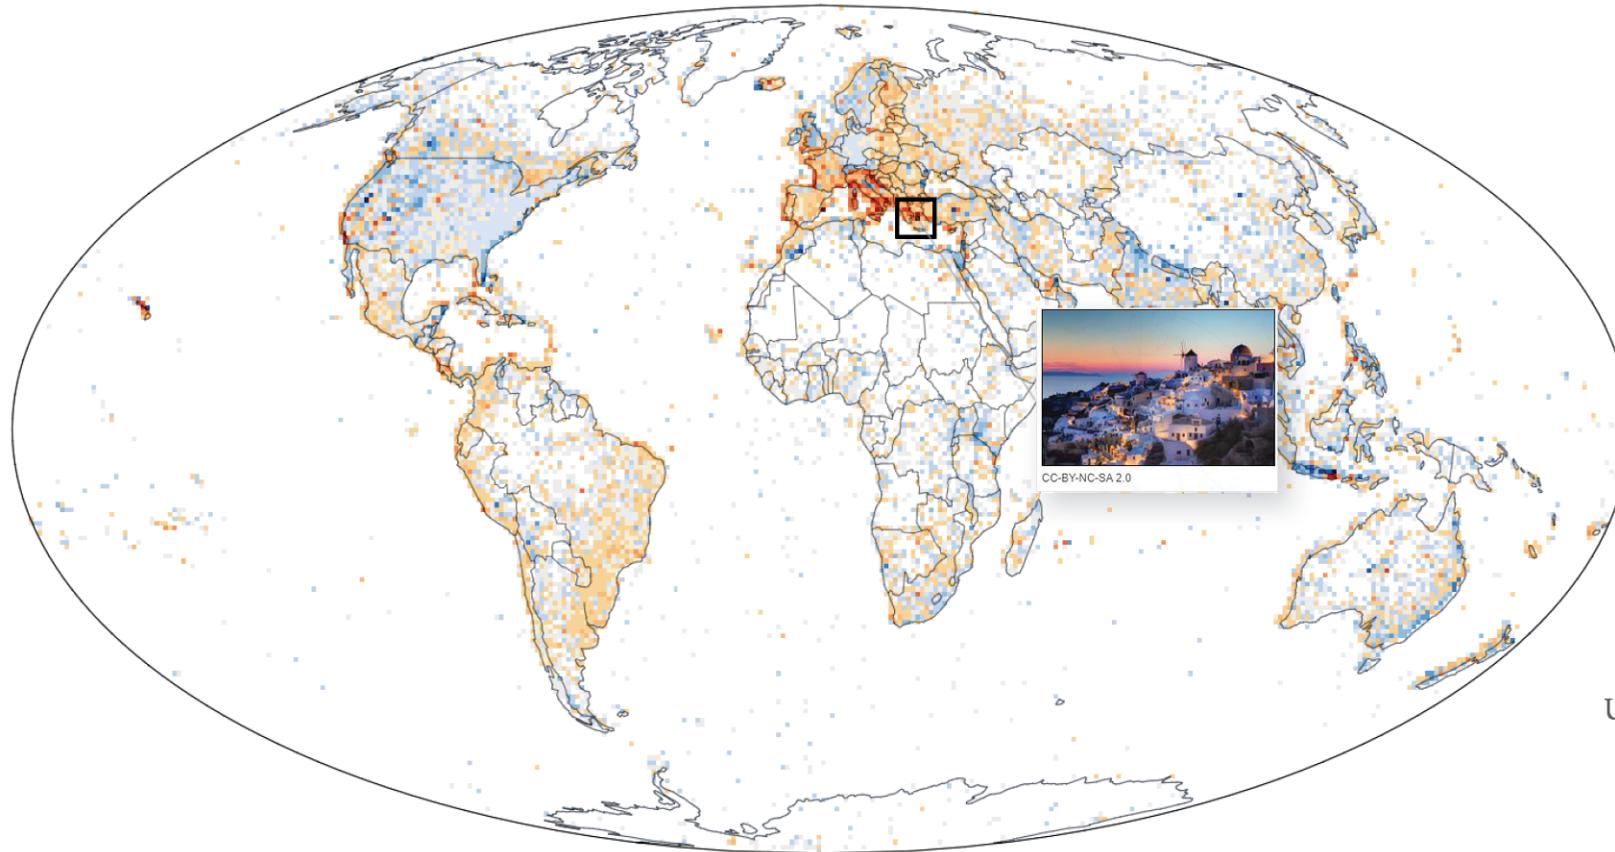

Sunset in Oia, Santorini

3.3 Million (obs) : 375 Million (exp) Flickr Images

► consensus among the top-ranked 20% of choices

21 Million (obs) : ~random 20 Million (exp) Instagram

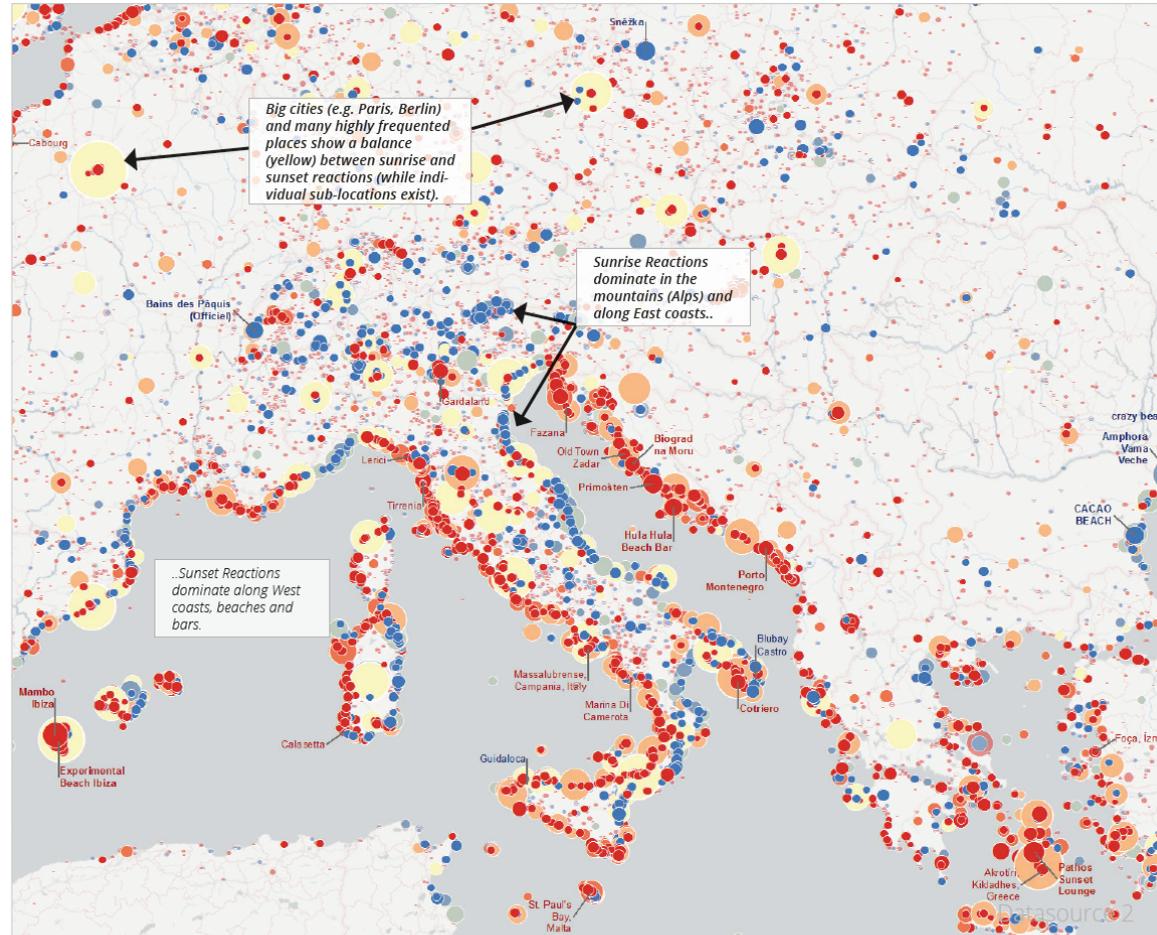

Underrepresented

Not significant

No data

► consensus among the top-ranked 20% of choices

LEGEND

Size

- 0.04 %
- 0.2 %
- 2 % of all reactions in dataset

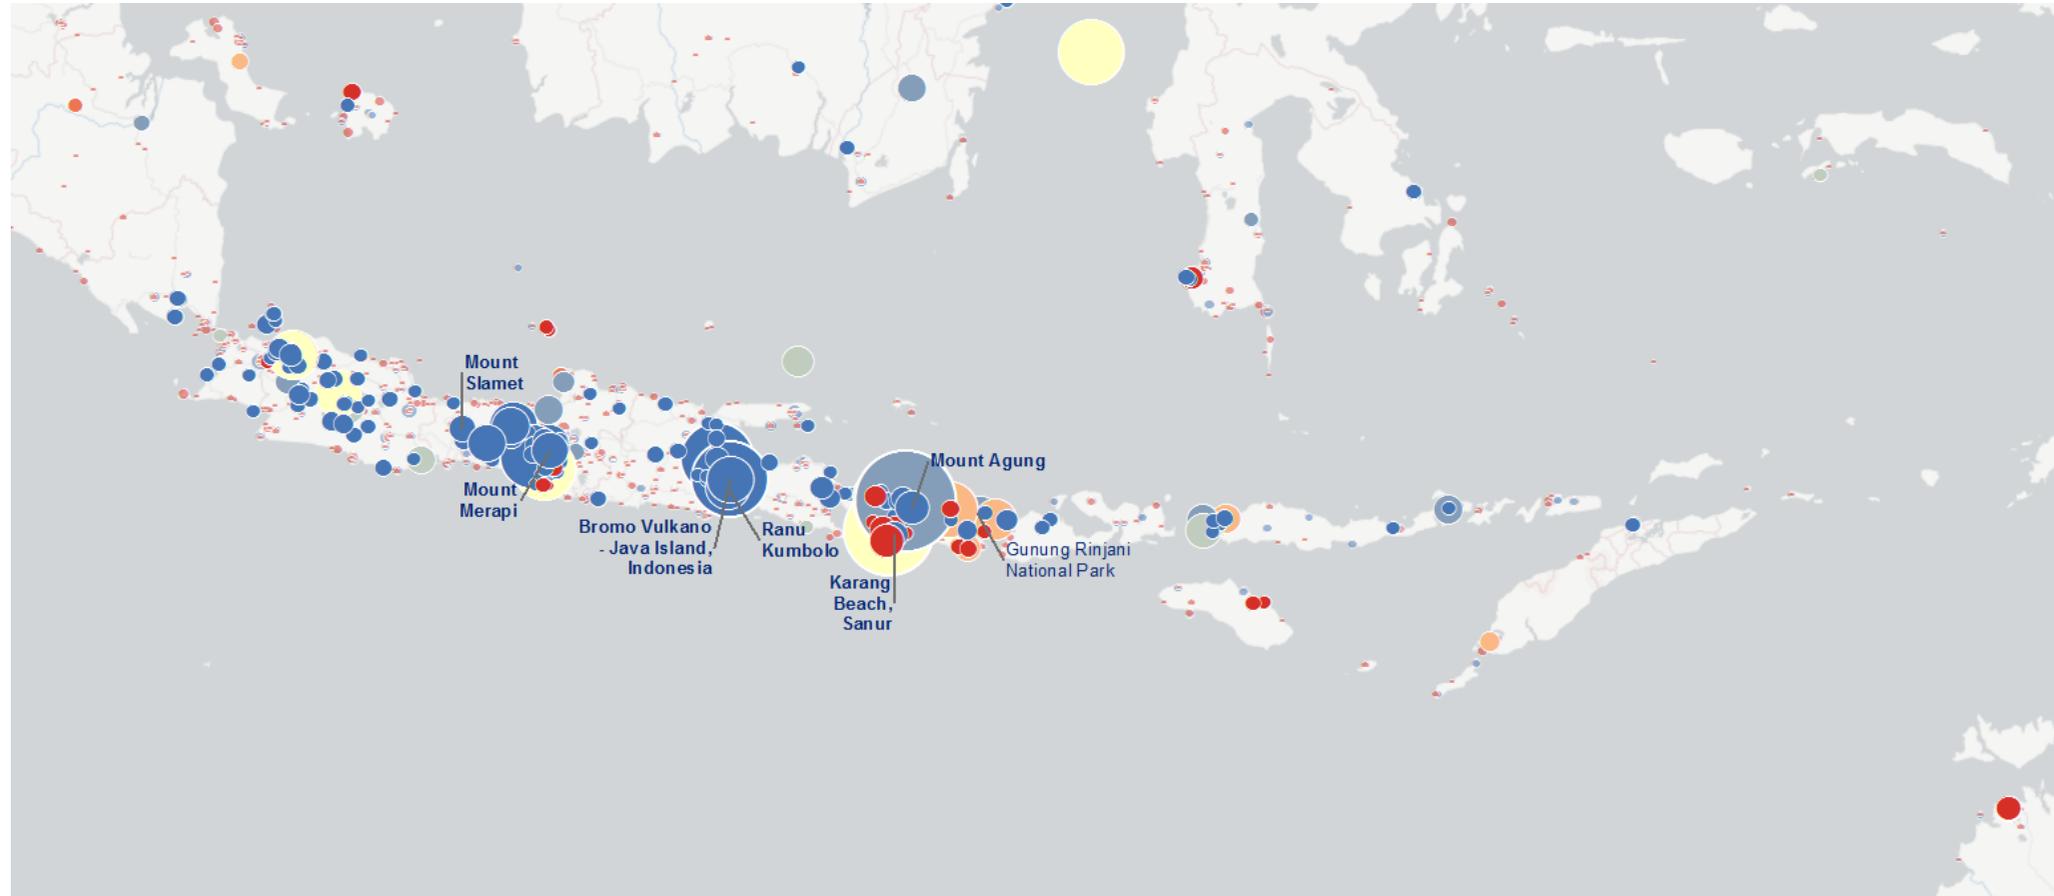

Color

- Sunrise reactions only
- ↕ Tendency towards Sunrise
- Balance Sunrise/Sunset
- ↕ Tendency towards Sunset
- Sunset reactions only
- Small databasis

Relative ranking of places (sunset and sunrise) for Central Europe.

Event Inventories?

Catalog events and temporal valuation patterns
for places and regions

Two key tasks:

1. Reduce **bias** in the data to increase representativeness
2. Increase **precision**, to derive more reliable and useful inferences

Rapacciuolo et al. (2021), p.1229 [↗](#)

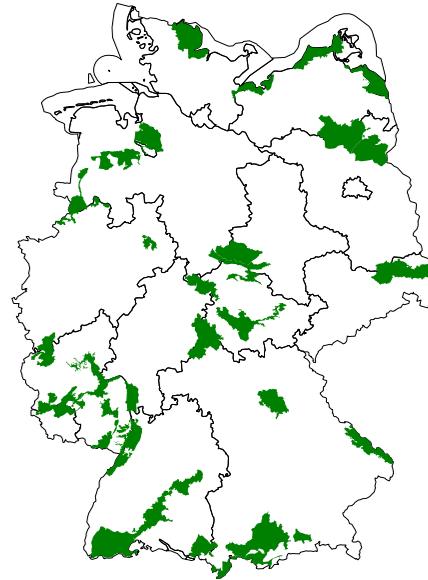

Reduce bias:

- through aggregation
- for example, by sampling from a larger, more representative number of observers and by integrating data from different platforms

Increase precision:

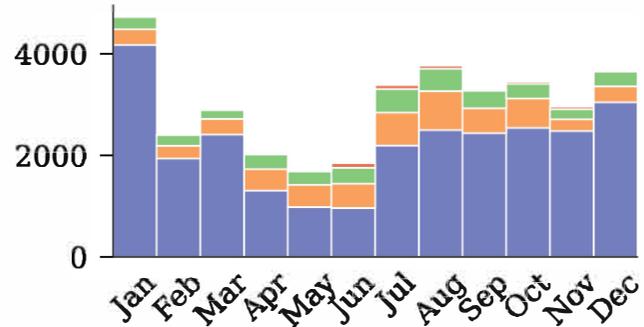

- through filtering
- for example, by querying based on time, space and semantics

Outlook: Towards *Event Inventories*

Challenges

- varying specificity as a key challenge in capturing landscape change through user-generated content
- fluctuating users and platform incentives
- data retrieval, API access

Thank You
